1 Introduction

Machine learning needs robust validation. We have clarified the specific contribution of our ensemble method in the abstract. (Reviewers 1.1)

2 Methodology

Here is the core of the problem. The regularization parameter β is chosen via cross-validation to balance bias and variance. (Reviewers 2.1, 3.2) This definition addresses the ambiguity pointed out regarding model complexity.

3 Experiments

We performed experiments on CIFAR-10. Table 2 has been updated to include standard deviation bars for all metrics. (Reviewers 1.3, 2.4)
